## Synthetic Wig Aftercare

With correct care, your Synthetic wig should last 4-6 months.

### Care Instructions

If worn daily, wash the wig every 2-3 weeks.

Prior to washing, gently remove all knots and tangle, paying particular attention to the nape area.

### Cleaning

**Never wash your hair in hot water.**

Wash your wig in **cold water** and apply a professional colour shampoo (paraben & sulphate free). Smooth the shampoo evenly through the hair. Rinse in **cold water**. Do not rub or agitate the hair.

### Conditioner

Always use a professional colour conditioner. Smooth the conditioner through the hair. Leave to soak for a few minutes and rinse in **cold water**. Do not rub or agitate the hair. We also suggest using a professional serum sparingly to maintain the shine & finish of the hair.

### Drying

Gently blot excess water with a towel. Please do not wring or twist. Shake the wig and ideally allow it to dry naturally placed on a wig stand or polyhead. If blow drying the hair, turn the wig inside out and first gently dry the base of the wig before drying the lengths of the hair. Always use no more than **cold heat**.

### Brushing

Please take care when brushing to avoid damage to the cap. It is recommended to use a soft brush for synthetic wigs. Don't over brush the wig as it may cause hair to shed.

### Styling

**Never** use intense heat on synthetic wigs, e.g. Hairdryers, ceramic irons, curling tongs.

Avoid opening oven doors and standing under overhead heaters as this can burn the fibre.

Please note that eventually the fibre will wear out and frizz, this is known as friction frizz.

We do not recommend sleeping in your wig as it will half the lifespan of the wig. If you do choose to occasionally sleep in your wig, we recommend using a silk pillowcase to minimise damage.
